

Controllers

• What's included?

- coordinates.server.controller.js (#1)
 - listings.server.controller.js (#2)
- What's defined?

- function that uses google maps to locate address and returns corresponding coordinates if address is specified (#1)
- CRUD functions that interact with DB (#2)
- middleware that retrieves listing by ID to be passed to next function (#2)

Router → Controller

• router uses URL information to route request to appropriate request handler defined in the controllers and the method used (put, post, get, delete)

Middleware

• allows functions to be invoked before reaching final request handler, so same code doesn't have to be written into each function that needs it
